WELONA

What’s broken.
And why it matters.

A product diagnosis of welona.in’s digital experience

Prepared by Vartha | Product Manager | April 2026

Today’s agenda

Understanding what’s broken before we fix it.

01	**The 3 problems your users face**	Decision making, fear, and proof of results
02	**Push vs Pull: the model mismatch**	Why the current site repels instead of attracts
03	**The broken user journey**	What happens from Google Ad to booking today
04	**What users actually search for**	The gap between user intent and your content
05	**Website audit findings**	Technical, UX, and trust failures
06	**The cost of doing nothing**	What this costs Welona every month

Your users have 3 problems

None of them are solved by the current website.

Decision paralysis

“Which treatment is right for me?”

They know their problem (hair fall, acne, weight) but don’t know the solution. The site lists treatments but never helps them choose.

Fear of the unknown

“Is this going to hurt or harm me?”

Medical treatments are scary. Users Google side effects before they Google clinics. Your site mentions zero side effects.

Proof anxiety

“Will this actually work for me?”

Before/after images feel curated. Users want timelines, session counts, realistic expectations. The site offers none.

The fundamental problem

Welona runs a push model. Users want a pull model.

Push model (current)

The clinic talks AT the user

- “Best clinic in Chennai”
- “Our experts will guide you”
- “Submit form, we’ll call you”
- No pricing shown
- No side effects mentioned
- User waits for the clinic

Pull model (what users want)

The user finds answers themselves

- “Take this quiz to find your treatment”
- “Here’s what PRP costs: ₹4K-8K/session”
- “Expect mild redness for 24 hours”
- “Book tomorrow 4 PM instantly”
- User is in control
- Trust is earned through transparency

Current user journey

Every step loses users. The funnel has 5 holes.

1

Google Ad click

User arrives with intent

→

2

Generic homepage

~70% bounce

No pricing, no quiz, no clarity

→

3

Browses treatments

~40% leave

Can't compare, no side effects

→

4

Fills lead form

~60% abandon

Just name + phone. No calendar.

→

5

Waits for callback

~50% lost

24-48hr delay. Competitor wins.

Result: For every 100 ad clicks, only ~2 become bookings. Welona pays for 100, converts 2.

What your users actually search for

The gap between user intent and what welona.in answers.

“PRP treatment side effects”	Not mentioned
“PRP treatment cost Chennai”	No pricing shown
“Which is better PRP or GFC”	No comparison tool
“Hair transplant recovery time”	Not detailed
“Best hair treatment for my age”	No quiz or filter
“Welona clinic reviews real”	Only screenshot images
“Book appointment Welona T Nagar”	Lead form only, no live slots

Every unanswered search = a user who leaves to find the answer on a competitor’s site or Reddit.

The trust gap

What users need to trust a medical clinic vs. what welona.in provides.

Doctor names, qualifications, photos	✗ Missing
Treatment pricing (even ranges)	✗ Missing
Side effects and recovery info	✗ Missing
Live Google/Justdial reviews widget	✗ Screenshot images only
Booking confirmation + calendar invite	✗ Lead form only
Treatment comparison tool	✗ Missing
Medical license / registration numbers	✗ Missing
ISO certification badge	✗ Mentioned in footer only

0 of 8 trust signals present. For a medical clinic, this is a conversion emergency.

Website audit: what’s broken

Technical, SEO, and structural findings from auditing welona.in

Technical

- Hosting suspension page indexed by Google
- Two Facebook Pixels firing duplicate data
- Duplicate pages: / and /hometest/ are identical
- Legacy /oldonline/ site still live and indexed
- Images are uncompressed WhatsApp screenshots

SEO & Content

- Footer says ©2023 — signals neglect
- Heavy keyword stuffing throughout
- No FAQ schema markup
- No structured data for local business
- No blog strategy beyond basic articles

UX & Conversion

- Zero pricing on any page
- Booking form is just name + phone
- No doctor profiles or credentials
- Reviews are screenshot images
- No treatment comparison capability

The cost of doing nothing

Every month the current site stays live, Welona loses money.

~2%

Current ad-to-booking conversion rate

98%

Of paid traffic leaves without booking

24-48hrs

Callback delay— competitor already won

Example monthly loss calculation

If Welona spends ₹1,00,000/month on Google Ads → ~2,000 clicks

At 2% conversion = ~40 bookings | At 15% conversion = ~300 bookings

260 lost bookings/month × ₹15,000 avg value = ₹39 lakhs/month in lost revenue

What users actually want

From user research and search behaviour analysis.

“Help me understand my options”	→	A quiz that asks about my problem and tells me the right treatment
“Tell me the real cost upfront”	→	An interactive estimator showing price ranges I can adjust
“Be honest about what could go wrong”	→	Transparent side effects with severity levels and timelines
“Let me book right now, not wait”	→	Live calendar with available slots, instant OTP confirmation
“Show me someone like me who got results”	→	Categorized patient stories filtered by concern, age, gender

Summary

The current site is a digital brochure, not a product. It pushes marketing messages instead of pulling users with answers.

Users need 3 things: help choosing a treatment, honest risk information, and proof it works. The site provides none of these.

The booking funnel has 5 leak points. For every 100 paid clicks, 98 users leave without booking.

Zero trust signals are present: no pricing, no side effects, no doctor profiles, no live reviews, no live booking.

The cost of inaction is measurable: potentially ₹30-40 lakhs/month in lost revenue from the same ad spend.

Next: The solution — a feature strategy that fixes every problem identified today.

The current system
is not broken by accident.
It was never built as a product.

Let’s build one.
